HLA−A / variants on the gene model

5,998 named alleles / 1,212 substitutions / 8 coding exons + 7 introns / introns ÷ 3

Stem anchors follow the reference CDS, including splice−split codons. The numbered coding−exon model spans ATG to stop.
Exons at native scale; intron gaps ÷ 3. Scale bars show actual base−pair lengths. Database counts, not population frequencies.
