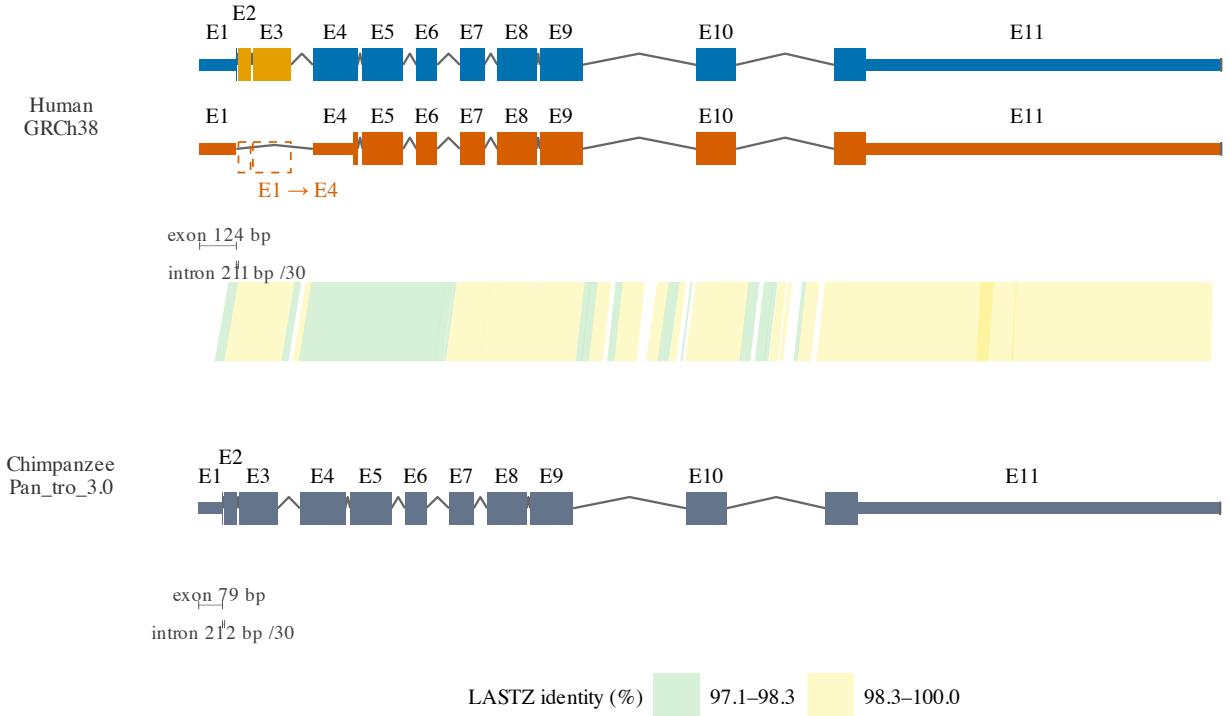
AS3MT transcripts: human–chimpanzee pairwise comparison

Exons at native scale · introns compressed 30-fold · full-reference exon numbers



Human upper row: full-length; lower row: paper-defined AS3MTd2d3 reconstruction.

Gold: E2/E3 in the full-length human transcript; dashed boxes: skipped in d2d3.

Thick: CDS; thin: UTR. The scale uses the exon union within each assembly panel.

Ungapped LASTZ DNA blocks: only the two highest identity categories shown; no within-block indels.

Links split at exon/intron scale boundaries automatically; ribbons do not measure expression.
