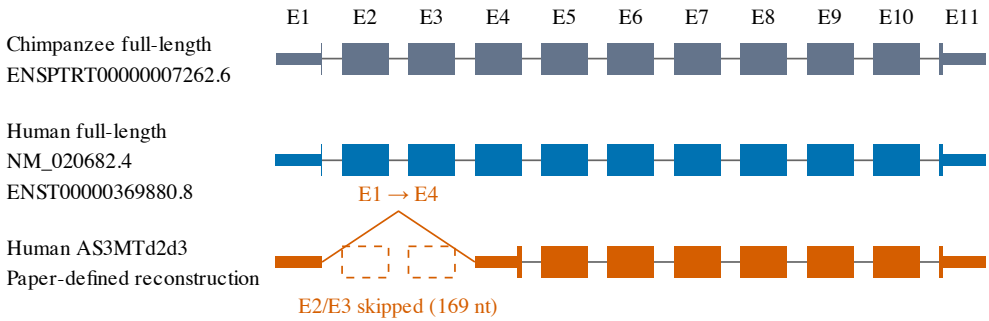
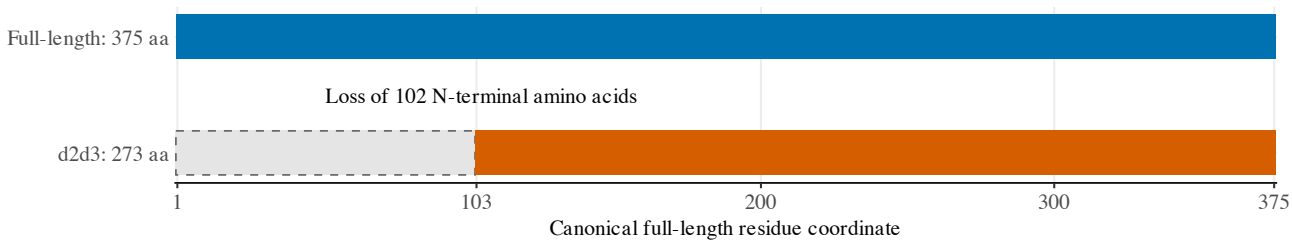
A Transcript architecture — schematic exon alignment

Corresponding exon slots; exon widths and intron gaps are not genomic distances.



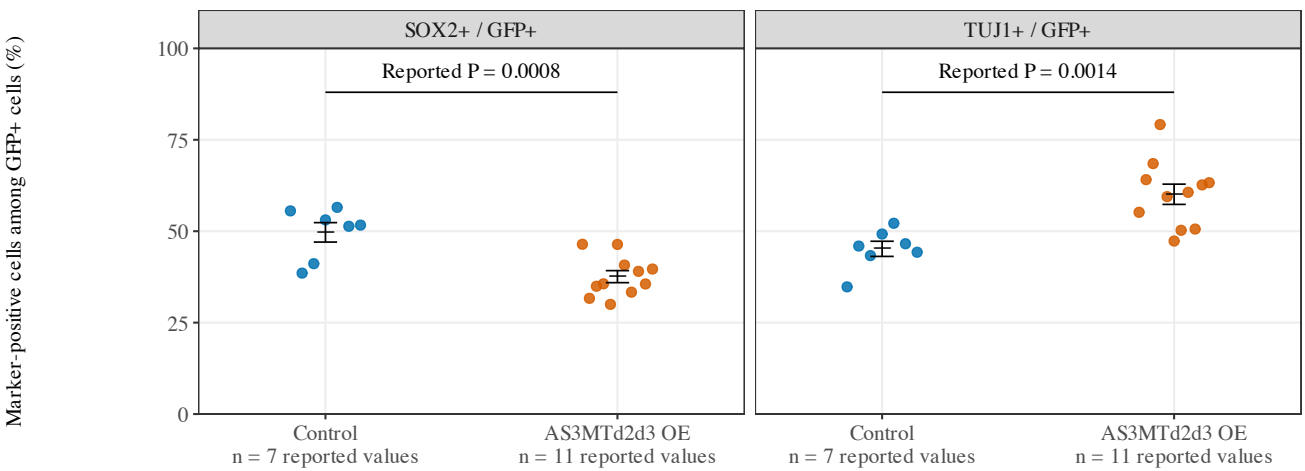
Thick boxes: CDS (including stop); thin boxes: UTR. Full-reference exon numbering retained.
Skipping destroys the split E1/E2 start codon; assigned downstream start lies in E4.
Human: GRCh38; chimpanzee: Pan_tro_3.0. Assembly-specific genomic views are in Figure 2.
Li et al.: chimp E1–E4 junction not detected in examined RNA-seq; this is not universal absence.

B Protein alignment



C Human forebrain organoids: control versus AS3MTd2d3 overexpression

H9/WA09; electroporation at day 50; individual reported values and mean ± SEM



Reported two-sided unpaired t tests; Kim et al. 2025, Fig. S8B–C / Table S5.
The publication does not define the sampling unit; n is not established as donors or organoids.
